Building Evolutionary Architectures

Evolutionary architectures are built one part at a time, with many different increments. Speed to the next increment is key.

Building Evolutionary Architectures

Building Evolutionary Architectures Support constant change The first principle of evolutionary architecture is to enable incremental change in an architecture over time.

The timely "Building Evolutionary Architectures" sits at the intersection of two key trends in the software industry. At one hand software engineers face increasing demand for delivery and quality at 'Internet' pace and scale. The only way to address this is to build evolving architectures. We do not have all the answers at the beginning, nor do we have time to find all the answers.

Building Evolutionary Architectures [Book]

The software development ecosystem is constantly changing, providing a constant stream of new tools, frameworks, techniques, and paradigms. Over the past few years, incremental developments in core engineering practices for software development have created the foundations for rethinking how architecture changes over time, along with ways to protect important architectural characteristics as ...

Building Evolutionary Architectures - O'Reilly Media

An evolutionary architecture supports building systems that allow architects and developers to make sweeping changes to the most important parts of their systems with confidence. Neal Ford offers a new perspective on evolving architecture, showing you how to make "evolvability" a first-class "-ility" in your software projects.

Building evolutionary architecture: Software Architecture ...

Join Allen Holub for a hands-on exploration of how to architect systems that easily evolve incrementally over time as requirements emerge. You'll solve a real-world problem under Allen's guidance, learning everything you need to know to go from an idea to an evolutionary implementation architecture.

Building evolutionary and incremental architectures ...

Microservices architecture is one great example of such an architecture, Rebecca Parsons and Neal Ford claims describing characteristics and principles of evolutionary architectures.

Characteristics of Evolutionary Architectures

An evolutionary architecture supports building systems that allow architects and developers to make sweeping changes to the most important parts of their systems with confidence. It covers practices that allow developers to build continual architectures, which evolve cleanly without the need for a crystal ball.

Building Evolutionary Architectures: Support Constant ...

An evolutionary architecture supports incremental, guided change as a first principle across multiple dimensions. For many years, software architecture was described as "the parts that are hard to change later". But then microservices showed that if architects build evolvability into the architecture

Building Evolutionary Architectures - ThoughtWorks

Architects face the challenge of planning for today's systems knowing that the problems of tomorrow will be completely different from the problems of today. Evolutionary architecture is an architectural approach that prioritises change as a first principle but balances this need with delivering value early.

Their proposal is evolutionary architecture, which is architecture that “supports guided, incremental change across multiple dimensions.” Incremental change is both “how teams build software” and “how they deploy it.”

Notes on Building Evolutionary Architectures.

One of the keys to building evolutionary architectures lies in determining natural component granularity and coupling between components to fit the capabilities they want to support via the software architecture. In evolutionary architecture, architects deal with architectural quanta, the parts of a system held together by hard-to-break forces. For example, transactions act like a strong nuclear force, binding together otherwise unrelated pieces.
